

Portfolio and Assessment Model

This assessment model fits the Studio Refresh version of ANL559. It rewards practical supervision, evidence, and judgement rather than long narrative reporting.

Portfolio Evidence

Each week contributes one portfolio bundle.

Week	Portfolio bundle	Minimum evidence
1	Reporting automation	Work order, metric definitions, reporting script, smoke-test output, AI-use-log entry
2	Data reconciliation	Row-count bridge, quarantine table, validation tests, trusted-number note
3	Decision model	Baseline table, leakage audit, threshold rationale, decision memo
4	Internal analytics product	API or dashboard, bad-input rejection, CI evidence, runbook
5	Analyst agent	Evaluation set, source-citation checks, refusal cases, before-and-after answer
6	Launch evidence pack	Launch checklist, incident timeline, evidence map, defence script

Suggested Weighting

Component	Weight	What is assessed
Weekly studio artefacts	30%	Does each artefact run, solve the mission, and include evidence?
Group demo	25%	Can the team operate the system and respond to critique?
Individual defence note	20%	Can the student explain what they accepted, rejected, fixed, and still distrust?
AI-use log	15%	Is agent use specific, honest, and tied to verification?
Participation in break/peer review	10%	Did the student find defects and help improve another team's artefact?

Studio Rubric

Use the same four criteria every week.

Criterion	Excellent	Adequate	Weak
Useful artefact	Runs from a clean checkout and directly solves the mission	Runs with minor setup help or solves part of the mission	Does not run or does not address the mission
Agent supervision	Agent output is reviewed, rejected or modified where appropriate, and logged	Agent use is visible but verification is thin	Agent output is accepted with little evidence of judgement
Break evidence	Meaningful defect found, reproduced, and prevented from recurring	Defect found and fixed once	No serious defect found, or defect discussed but not reproduced
Defence	Claims are specific, evidence-linked, and include limits	Claims are plausible but lightly evidenced	Claims are vague, overconfident, or unsupported

Viva Prompts

Use these prompts for individual defence:

1. Show me one place where the agent was wrong.
2. Show me the evidence that changed your mind.
3. What would fail if this system were used by ten times more people?
4. Which claim in your portfolio is strongest, and which is weakest?
5. What should not be shipped yet?

Marker Guidance

Do not reward polish alone. A clean slide deck with no defect evidence is weaker than a rough artefact with a clear failure, fix, and defence.

The central question is:

Did the student supervise an AI agent into producing reliable analytics work?
